PROOF OF WORK · PORTFOLIO WEB APPLICATION

Personal Portfolio Web App with Headless CMS and Integrated Analytics — Built, Deployed and Managed Without an Agency, Without a Template, and Without a Monthly Bill

Independent build · UAE job market · April 2026

Web Development · Headless CMS · CI/CD Automation · Google Analytics · OAuth · Cloudflare · GitHub Actions · AI Assisted Build

Built with Claude (Anthropic)

Every line of code, every configuration file, every integration and every fix in this project was written by Claude, Anthropic's AI assistant. All product decisions, platform tasks, architectural choices and delivery direction were owned and executed by Me. The full breakdown of responsibilities is covered in The TPO Layer section below.

THE SITUATION

Most Technical Product Owners have a CV. Very few have a working product that demonstrates both their thinking and their ability to direct execution without doing the coding themselves. The goal here was to build a portfolio that functioned as a live product with a no-code back office, content management, analytics, and zero ongoing cost, while documenting exactly how it was built so it could stand as proof of work in its own right.

There was no agency. No template. No paid platform. The entire system was specified, directed and iterated using Claude as the execution layer, with every technical decision made and owned by Me.

THE TPO LAYER

Claude wrote the code. I directed everything else. Here is the breakdown of what I personally executed throughout this build:

→ **Product decisions:** Defined what to build, in what order, and why — including the CMS architecture, auth approach, analytics integration strategy, CI/CD pipeline design, and the individual vs single-file project management trade-offs

→ **GitHub setup:** Created and configured the GitHub repository, set up GitHub Pages deployment, managed branch settings, resolved deployment timeouts and triggered redeployments

→ **GitHub OAuth app:** Registered the GitHub OAuth application, generated and managed the Client ID and Client Secret, set the Authorization Callback URL for the Cloudflare Worker, and rotated credentials when needed

→ **Google Cloud:** Created the Google Cloud project, enabled the Google Analytics Data API, configured the OAuth consent screen, created the OAuth 2.0 web application credentials, added test users, and generated the Google Client ID and Client Secret

→ **Cloudflare Workers:** Created the Cloudflare account, deployed the cms-auth Worker, pasted and updated the Worker code for both GitHub and Google OAuth routes, and verified the Worker URL endpoints

→ **Netlify:** Set up the initial Netlify project, connected it to the GitHub repo, configured build settings, enabled Identity and Git Gateway, invited test users, diagnosed the usage limit issue and directed the migration away from Netlify to Cloudflare

→ **Google Analytics:** Created the GA4 property, retrieved the Measurement ID, connected the account via the GA panel OAuth flow, confirmed live stats were populating, and identified the incorrect Property ID that was causing blank stats

→ **Quality review:** Reviewed every output against expectations, caught the Broadcasting typo, flagged the photo size issue, identified the delete confirmation loop, spotted the Netlify identity widget that should have been removed, and directed every fix

→ **Content:** Provided all professional content including the proof of work descriptions, skills lists, experience bullets, certifications and personal details used across the site and CMS

WHAT WAS SPECIFIED AND DELIVERED

→ A single-page portfolio application in HTML, CSS and vanilla JavaScript with Auto/Light/Dark theme switching, full responsiveness, fade-in animations and Google Docs Viewer integration for in-browser PDF rendering of proof of work documents

→ A headless CMS back office deployed at a custom dashboard URL using Sveltia CMS — all content editable without code including hero text, about summary, experience roles, proof of work cards, education, section visibility and site settings

→ GitHub OAuth authentication via a Cloudflare Worker — secure CMS login with no Netlify dependency and no monthly cost

→ A GitHub Actions CI/CD pipeline that automatically regenerates the projects manifest every time a proof of work entry is added, edited or deleted via the CMS — each change produces a clean, isolated, reversible Git commit

→ Google Analytics 4 event tracking on every meaningful interaction including resume views, resume downloads, and per-project view and download clicks with the project title as the event label

→ A live analytics panel embedded directly inside the CMS dashboard showing total visitors, page views, resume downloads and project views with a Today/7/14/30-day date range selector, quick links to GA reports, and Connect and Disconnect GA functionality

→ Section visibility toggles in the dashboard that show or hide any portfolio section on the live site without touching code

$0	6	100%
Total monthly running cost	Free-tier services integrated	Content editable without code

SYSTEMS USED — ALL FREE

Service	Cost	What it does
GitHub Pages	**$0 Free**	Hosts the live portfolio site
Sveltia CMS	**$0 Free**	No-code back office for all content

Cloudflare Workers	**$0 Free**	OAuth authentication for CMS and GA
Google Analytics 4	**$0 Free**	Site visits and event tracking
Google Cloud OAuth	**$0 Free**	Secure GA API access from dashboard
GitHub Actions	**$0 Free**	Auto-regenerates project manifest on change

DASHBOARD IN ACTION

The following screenshots show the CMS back office managing live portfolio content, proof of work entries, section visibility controls and the embedded Google Analytics panel.

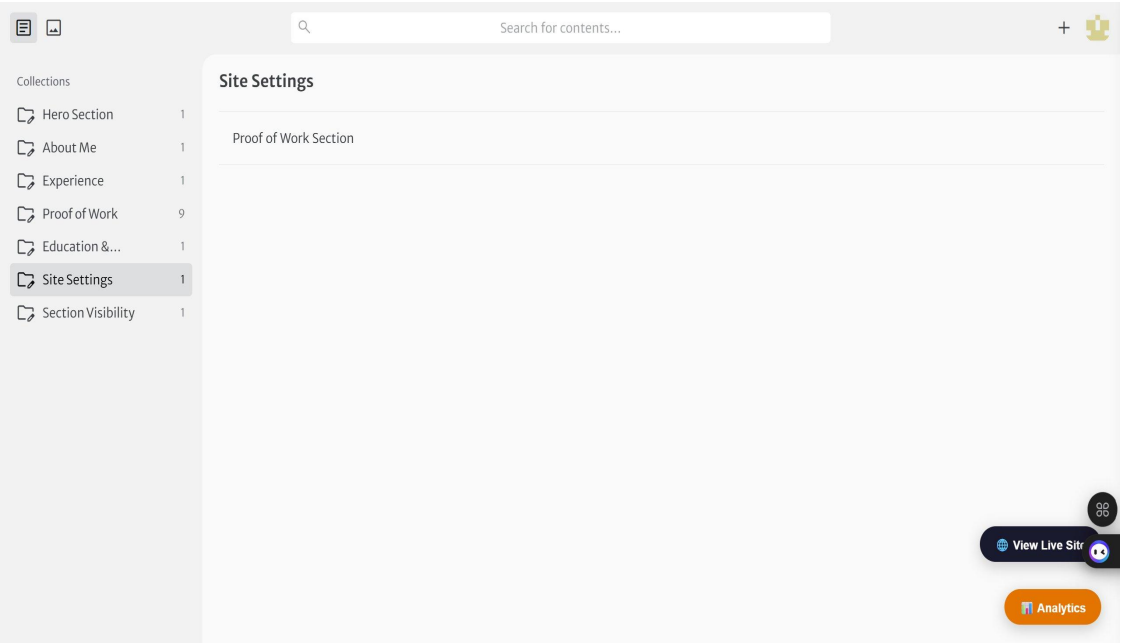

Figure 1: Collections sidebar showing all editable sections including Site Settings and Section Visibility

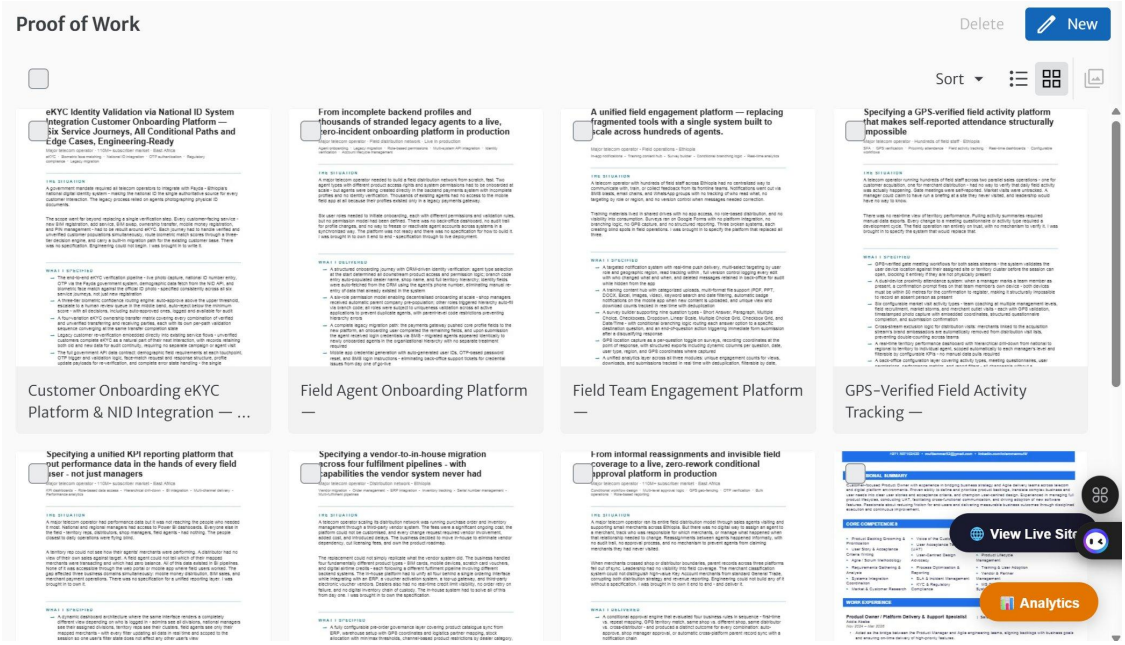

Figure 2: Proof of Work grid view showing all project entries with document previews and full edit access

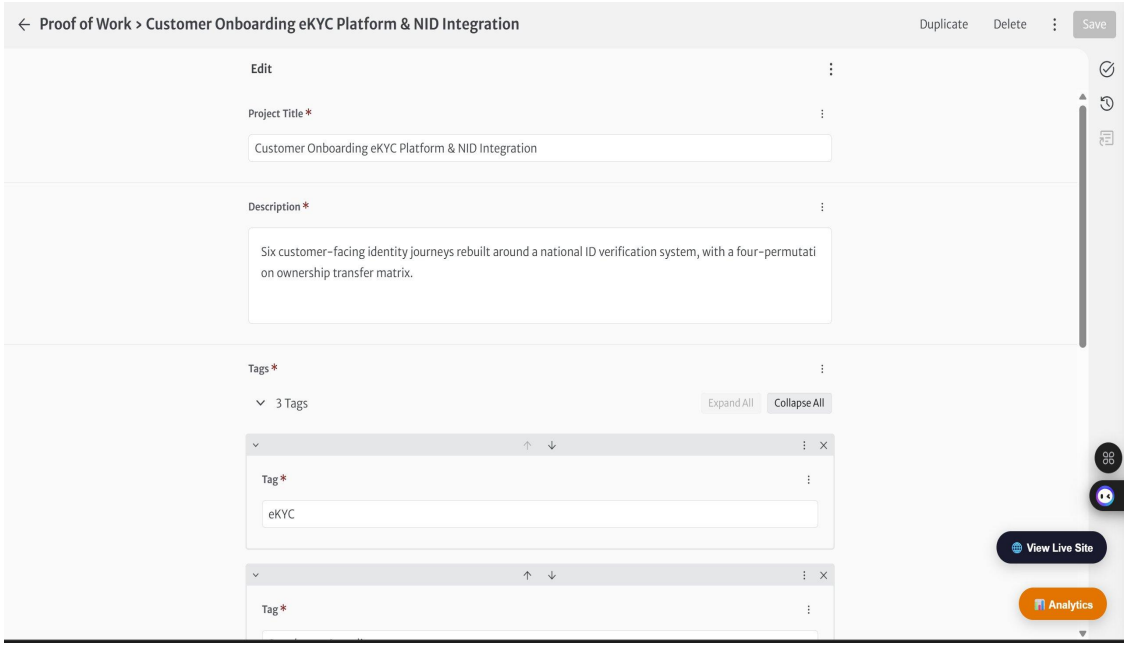

Figure 3: Individual project edit view showing title, description and tags fields

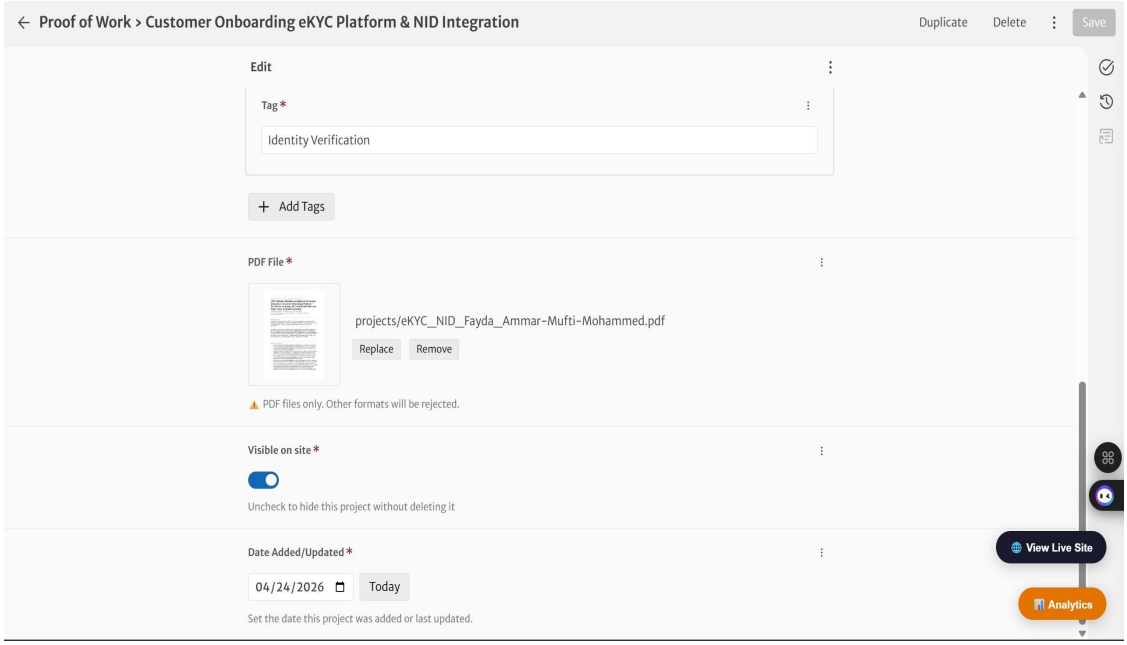

Figure 4: Individual project edit view showing PDF upload, visibility toggle and date field

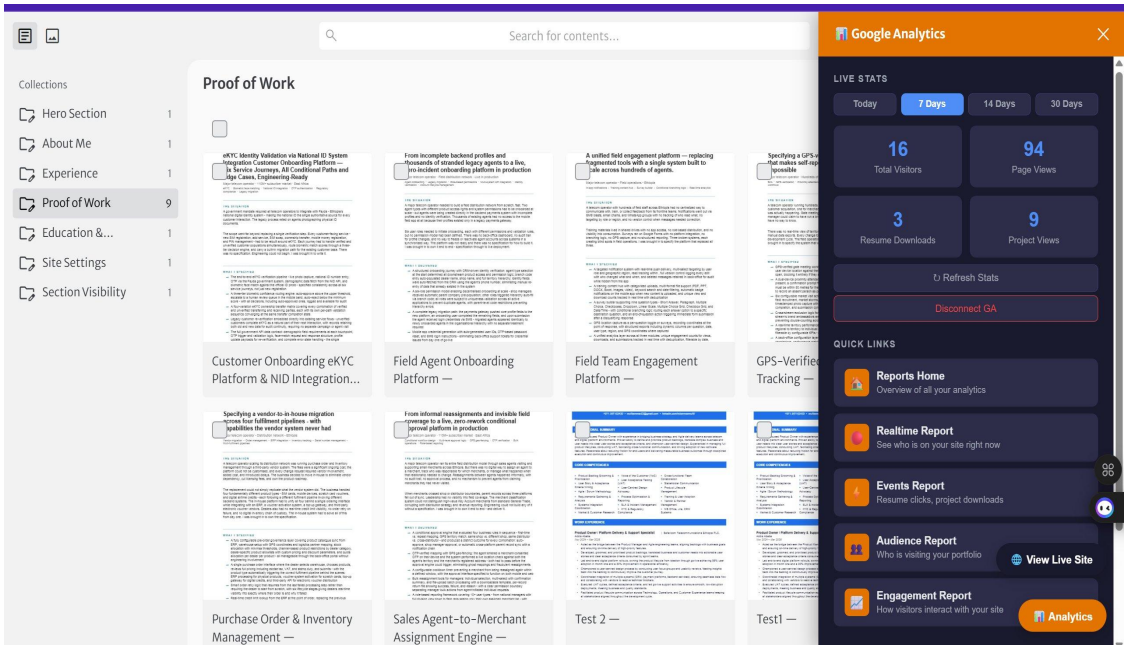

Figure 5: Google Analytics panel open inside the CMS showing live stats with 7-day view and quick links

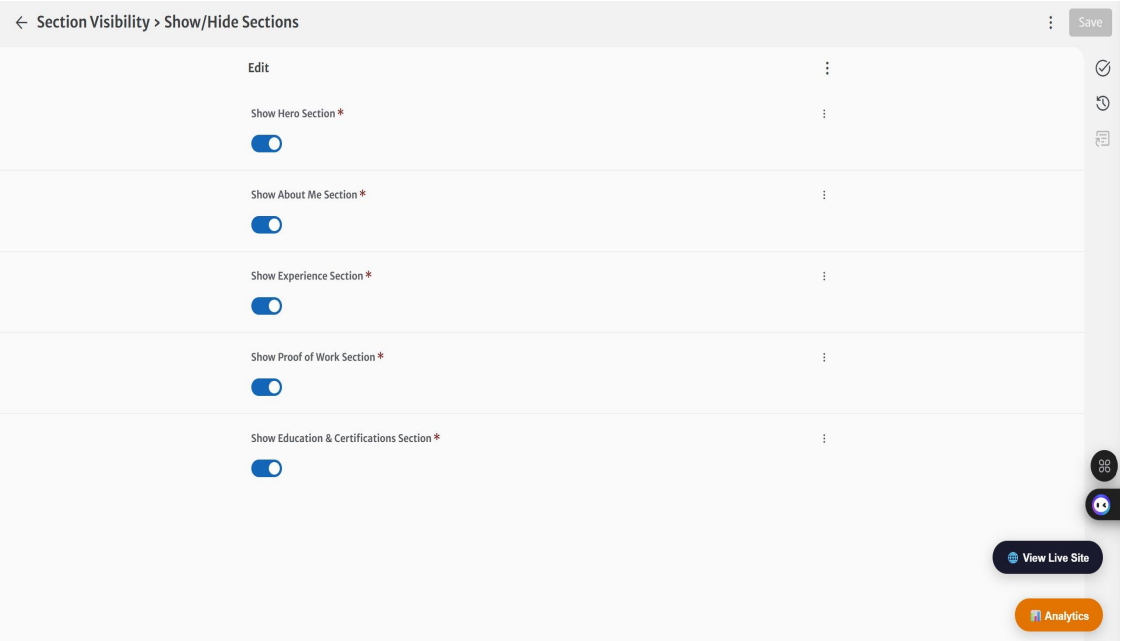

Figure 6: Section Visibility controls for toggling any section on or off without code changes

WHY IT MATTERS FOR YOU

This project demonstrates what modern AI-assisted product delivery looks like in practice. The code was written by Claude. Every requirement, every architectural decision, every integration choice, every correction and every iteration was directed by Me. That is precisely the skill set a Technical Product Owner brings to an engineering team, not writing the code, but knowing exactly what to specify, what to push back on, and how to get from a blank brief to a working system.

The ability to direct AI as a delivery layer, with the same rigour used to coordinate engineers, vendors and integration teams at Safaricom Ethiopia, a capability that will define the next generation of technical product roles. This build is a demonstration of that capability in a real, live, working product.
